Constraint Satisfaction [RN2] Sec 5.1-5.2 [RN3] Sec 6.1-6.3

CS 486/686 Lecture 5: Sept 25, 2012 University of Waterloo

CS486/686 Lecture Slides (c) 2012 K. Larson and P. Poupart

1

Outline

- · What are CSPs?
- · Standard search and CSPs
- Improvements
 - Backtracking
 - Backtracking + heuristics
 - Forward checking

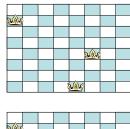

2

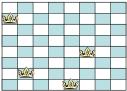

Introduction

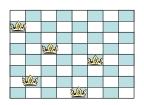

- In the last couple of lectures we have been solving problems by searching in a space of states
 - Treating states as black boxes, ignoring any structure inside them
 - Using problem-specific routines
- Today we study problems where the state structure is important

CS486/686 Lecture Slides (c) 2012 K. Larson and P. Poupart

3

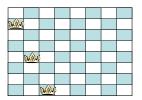

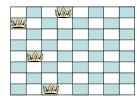

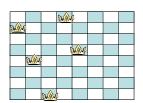

- States: all arrangements of 0,1,..., or 8 queens on the board
- Initial state: 0 queens on the board
- Successor function: Add a queen to the board
- Goal test: 8 queens on the board with no two of them attacking each other

 $64 \times 63 \times ... 57 \approx 3 \times 10^{14} \text{ states}$

4

- States: all arrangements k queens (0 ≤ k ≤ 8), one per column in the leftmost k columns, with no queen attacking another
- Initial state: 0 queens on the board
- Successor function: Add a queen to the leftmost empty column such that it is not attacked
- Goal test: 8 queens on the board

2057 States

5

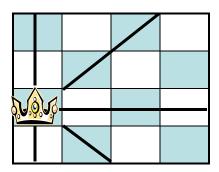

CS486/686 Lecture Slides (c) 2012 K. Larson and P. Poupart

Introduction

- Earlier search methods studied often make choices in an arbitrary order
- In many problems the same state can be reached independent of the order in which the moves are chosen (commutative actions)
- Can we solve problems efficiently by being smart in the order in which we take actions?

CS486/686 Lecture Slides (c) 2012 K. Larson and P. Poupart

CSP Definition

- A constraint satisfaction problem (CSP) is defined by {V,D,C} where
 - $V = \{V_1, V_2, ..., V_n\}$ is a set of variables
 - $D=\{D_1,...,D_n\}$ is the set of domains, D_i is the domain of possible values for variable V_i
 - $C=\{C_1,...,C_m\}$ is the set of constraints
 - Each constraint involves some subset of the variables and specifies the allowable combinations of values for that subset

11

CS486/686 Lecture Slides (c) 2012 K. Larson and P. Poupar

CSP Definition

- A state is an assignment of values to some or all of the variables
 - $\{V_i = x_i, V_j = x_j,...\}$
- An assignment is consistent if it does not violate any constraints
- A solution is a complete, consistent assignment ("hard constraints")
 - Some CSPs also require an objective function to be optimized ("soft constraints")

12

Example 1: 8-Queens

- 64 variables V_{ij}, i=1 to 8, j=1 to 8
- Domain of each variable is {0,1}
- · Constraints
 - V_{ij} =1 \rightarrow V_{ik} =0 for all $k \neq j$
 - V_{ij} =1 \rightarrow V_{kj} =0 for all $k \neq i$
 - Similar constraint for diagonals
 - $\sum_{i,j} V_{i,j} = 8$

Binary constraints relate two variables

CS486/686 Lecture Slides (c) 2012 K. Larson and P. Poupart

13

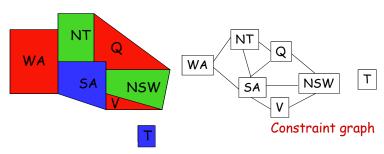

Example 2 - 8 queens

- 8 variables V_i, i=1 to 8
- Domain of each variable is {1,2,...,8}
- · Constraints
 - V_i = $k \rightarrow V_j \neq k$ for all $j \neq i$
 - Similar constraints for diagonals

Binary constraints relate two variables

14

Example 3 - Map Coloring

- 7 variables {WA,NT,SA,Q,NSW,V,T}
- Each variable has the same domain: {red, green, blue}
- No two adjacent variables have the same value:

WA≠NT, WA≠SA, NT≠SA, NT≠Q, SA≠Q, SA≠NSW, SA≠V,Q≠NSW, NSW≠V

CS486/686 Lecture Slides (c) 2012 K. Larson and P. Poupart

15

Example from R and N, Annotations from Stanford CS121

Example 4 - Street Puzzle

N_i = {English, Spaniard, Japanese, Italian, Norwegian}

Ci = {Red, Green, White, Yellow, Blue}

D_i = {Tea, Coffee, Milk, Fruit-juice, Water}

Ji = {Painter, Sculptor, Diplomat, Violinist, Doctor}

A; = {Dog, Snails, Fox, Horse, Zebra}

The Englishman lives in the Red house

The Spaniard has a Dog

The Japanese is a Painter

The Italian drinks Tea

The Norwegian lives in the first house on the left

The owner of the Green house drinks Coffee

The Green house is on the right of the White house

The Sculptor breeds Snails

The Diplomat lives in the Yellow house

The owner of the middle house drinks Milk

The Norwegian lives next door to the Blue house

The Violinist drinks Fruit juice

The Fox is in the house next to the Doctor's

The Horse is next to the Diplomat's

CS486/686 Lecture Slides (c) 2012 K. Larson and P. Poupart

Who owns the Zebra? Who drinks Water?

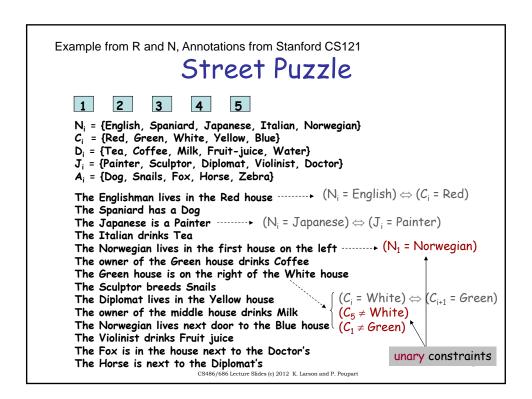

```
Example from R and N, Annotations from Stanford CS121

```

Example 5 - Scheduling

cture Slides (c) 2012 K. Larson and P. Poupart

Four tasks T_1 , T_2 , T_3 , and T_4 are related by time constraints:

- T₁ must be done during T₃
- \cdot T₂ must be achieved before T₁ starts
- T₂ must overlap with T₃

The Horse is next to the Diplomat's

- \cdot T₄ must start after T₁ is complete
- Are the constraints compatible?
- What are the possible time relations between two tasks?
- What if the tasks use resources in limited supply?

22

Example 6 - 3-Sat

- n Boolean variables, V₁,...,V_n
- K constraints of the form $V_i v V_j v V_k$ where V_i is either true or false
- · NP-complete

CS486/686 Lecture Slides (c) 2012 K. Larson and P. Poupart

Properties of CSPs

- · Types of variables
 - Discrete and finite
 - · Map colouring, 8-queens, boolean CSPs
 - Discrete variables with infinite domains
 - Scheduling jobs in a calendar
 - Require a constraint language ($Job_1+3 \le Job_2$)
 - Continuous domains
 - Scheduling on the Hubble telescope
 - Linear programming

24

23

Properties of CSPs

- Types of contraints
 - Unary constraint relates a variable to a single value
 - · Queensland=Blue, SA≠Green
 - Binary constraints relates two variables
 - SA≠NSW
 - Can use a constraint graph to represent CSPs with only binary constraints
 - Higher order constraints involve three of more variables
 - Alldiff(V₁,...,V_n)
 - · Can use a constraint hypergraph to represent the problem

25

CS486/686 Lecture Slides (c) 2012 K. Larson and P. Poupari

CSPs and search

- N variables V₁,...,V_n
- Valid assignment: $\{V_1=x_1,...,V_k=x_k\}$ for $0 \le k \le n$ such that values satisfy constraints on the variables
- · States: valid assignments
- Initial state: empty assignment
- Successor:

$$\text{- } \{\mathsf{V}_1\text{=}\mathsf{x}_1, \dots, \mathsf{V}_{\mathsf{K}}\text{=}\mathsf{x}_{\mathsf{k}}\} \to \{\mathsf{V}_1\text{=}\mathsf{x}_1, \dots, \mathsf{V}_{\mathsf{k}}\text{=}\mathsf{x}_{\mathsf{k}}, \ \mathsf{V}_{\mathsf{k}+1}\text{=}\mathsf{x}_{\mathsf{k}+1}\}$$

- Goal test: complete assignment
- If all domains have size d, then there are $O(d^n)$ complete assignments

CSPs and commutativity

- CSPs are commutative!
 - The order of application of any given set of actions has no effect on the outcome
 - When assigning values to variables we reach the same partial assignment, no matter the order
 - All CSP search algorithms generate successors by considering possible assignments for only a single variable at each node in the search tree

27

CS486/686 Lecture Slides (c) 2012 K. Larson and P. Poupar

CSPs and commutativity

- 3 variables V₁, V₂, V₃
- · Let the current assignment be
 - $A = \{V_1 = x_1\}$
- · Pick variable 3
- Let domain of V_3 be $\{a,b,c\}$
- · The successors of A are
 - $\{V_1 = x_1, V_3 = a\}$
 - $\{V_1 = x_1, V_3 = b\}$
 - $\{V_1 = x_1, V_3 = c\}$

28

Backtracking Search

```
function Backtracking-Search (csp) returns a solution, or failure return Recursive-Backtracking(\{\}, csp) function Recursive-Backtracking (assignment, csp) returns a solution, or failure if assignment is complete then return assignment var \leftarrow Select-Unassigned-Variable (<math>variables[csp], assignment, csp) for each value in Order-Domain-Values (var, assignment, csp) do if value is consistent with assignment according to Constraints [csp] then add \{var = value\} to assignment result \leftarrow Recursive-Backtracking (<math>assignment, csp) if result \neq failue then return result remove \{var = value\} from assignment return failure
```

Depth first search which chooses values for one variable at a time

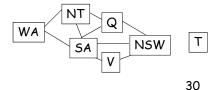

Backtracks when a variable has no legal values to assign

29

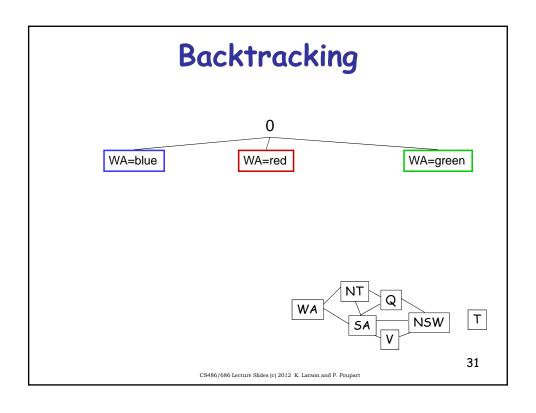

CS486/686 Lecture Slides (c) 2012 K. Larson and P. Poupart

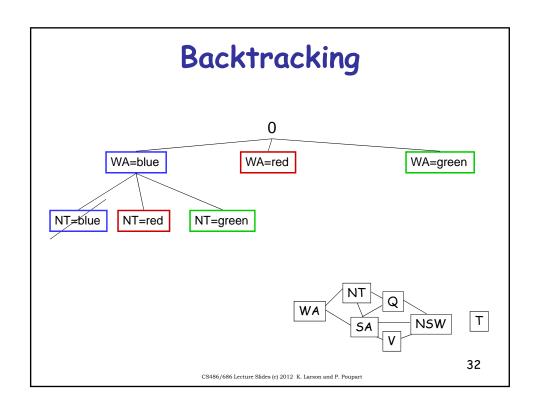

Backtracking

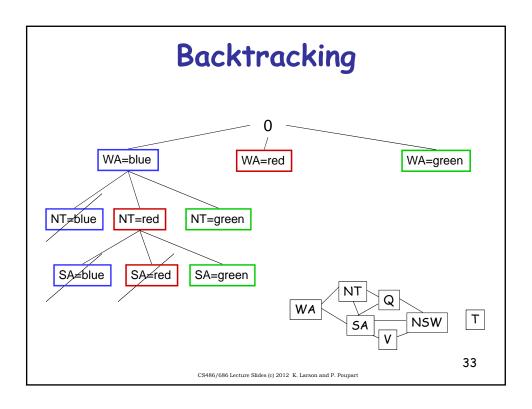

0

CS486/686 Lecture Slides (c) 2012 K. Larson and P. Poupart

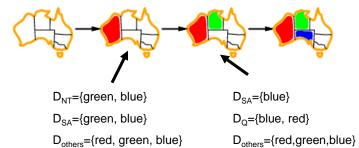

Backtracking and efficiency

- Backtracking search is an uninformed search method
 - Not very efficient
- We can do better by thinking about the following questions
 - Which variable should be assigned next?
 - In which order should its values be tried?
 - Can we detect inevitable failure early (and avoid the same failure in other paths)?

Most constrained variable

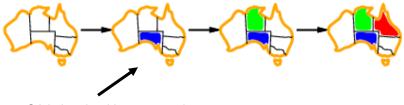

- Choose the variable which has the fewest "legal" moves
 - AKA minimum remaining values (MRV) heuristic

CS486/686 Lecture Slides (c) 2012 K. Larson and P. Poupart

Most constraining variable

- Most constraining variable:
 - choose the variable with the most constraints on remaining variables
- Tie-breaker among most constrained variables

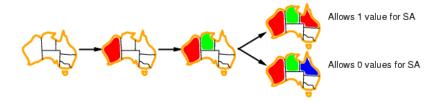

SA is involved in 5 constraints

36

35

Least-constraining value

- Given a variable, choose the least constraining value:
 - the one that rules out the fewest values in the remaining variables

CS486/686 Lecture Slides (c) 2012 K. Larson and P. Poupart

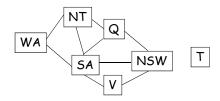

37

Forward checking

- · The third question was
 - Is there a way to detect failure early?
- · Forward checking
 - Keep track of remaining legal values for unassigned variables
 - Terminate search when any variable has no legal values

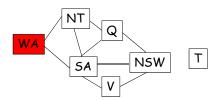

38

Forward Checking in Map Coloring
